Additional Crash Statistics

Crashes by Month 2013-2017

The variation of crashes by month is shown below. The number of crashes varies by more than 30% from month to month with more crashes occurring in the fall and winter than in the spring and summer. Inclement weather and a higher student population at those times likely contribute to the increase seen during the colder months.

Crashes by Day of Week 2013-2017

The chart below shows that more crashes occur on Fridays than on other days of the week. Daily variation in crashes tracks closely with daily variation in traffic volumes (brown line).

Crashes by Time of Day 2013 – 2017

The graphs below show crashes by time of day for weekdays, Saturdays and Sundays respectively. The charts also show the percentage of daily traffic by hour (brown line).

On weekdays (Monday-Friday), crashes are overrepresented during the afternoon peak hours from 3 p.m. to 5 p.m.. That is, there are more crashes than expected given the amount of traffic on the streets at those times.

On weekends, early morning hours on Saturdays and Sundays are significantly overrepresented. Around 1 a.m. to 2 a.m. on Saturdays and Sundays, there are two to three times as many crashes as would be expected given the traffic volumes at those times. This data suggests that evening activities and alcohol use on weekends may contribute to a high number of crashes. (See page 11 for more data on alcohol related crashes.) Interestingly, the noon hour on Saturdays and Sundays is overrepresented.
