The Natural Photic Environment

The Natural Photic Environment

The Natural Photic Environment

What is Light Pollution

The inappropriate or excessive use of artificial light which brightens the natural sky and surrounding environment. Light Pollution is primarily composed of:

- Glare - excessive brightness that causes visual discomfort
- Skyglow - light scattered and reflected off of air molecules and atmospheric aerosols
- Light Trespass - light falling where it is not intended or needed

Skyglow

Glare

Skyglow

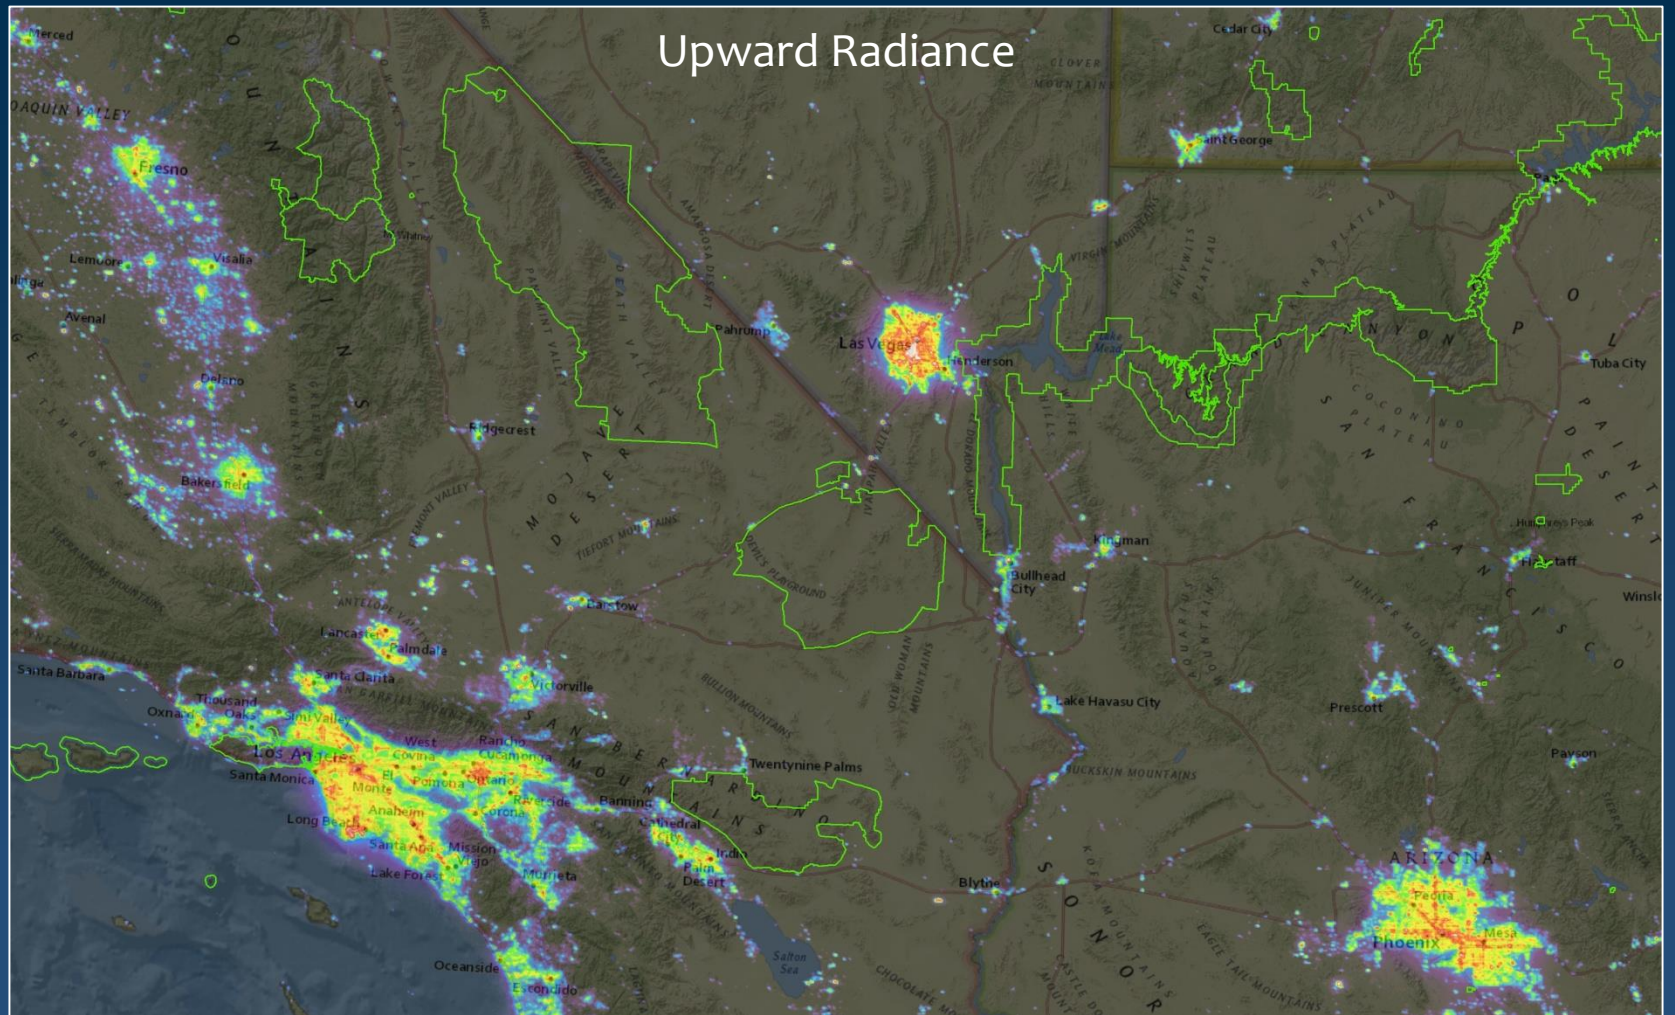

Light Trespass

19:13

Light pollution is amplified locally from cloud cover, fog, and haze.

This low cloud bank increased overhead sky brightness by 15x

Measuring the Night Sky

16 bit monochrome image,
photometric calibration
from standard stars

Calibration applied to each
pixel gives brightness
measurement (luminance)

Same system to measure
local scene luminance

Fully Sustainable Lighting

Fully Sustainable Outdoor Lighting

- ❖ Light only where you need it
- ❖ Light only when you need it
- ❖ Shield lights and direct them downward
- ❖ Use the minimum amount of light necessary
- ❖ Select lamps with warmer colors
- ❖ Use the most energy efficient lamps and fixtures
