Program Objectives

Colorado Mosquito Control, LLC (CMC) completed its 12th year of cost effective Integrated Mosquito Management (IMM) for the City of Fort Collins in 2015. The primary objective of this IMM Program is to monitor and reduce mosquito populations through the use of specific, environmentally sound, control techniques in order to protect its residents from the threat of mosquito-borne diseases. CMC prioritizes the detection and elimination of larval mosquitoes in aquatic habitats, in conjunction with the monitoring of adult mosquito populations through routine surveillance, in order to assess West Nile virus vector species abundance.

Open communication is maintained by CMC between the City of Fort Collins, the Larimer County Department of Health & Environment, the Colorado Department of Public Health and Environment and surrounding municipalities in order to ensure that the highest level of mosquito control and epizootic response is achieved. This diligent and cooperative communication is important to the City of Fort Collin's mosquito management program and provides significant benefit to public health throughout the entire area.

CMC 's Commitment

Colorado Mosquito Control is a company built on the foundations of public health, ethics, professionalism, and technical expertise. CMC is committed to providing our customers with scientifically based, environmentally sensitive and technologically advanced Integrated Mosquito Management (IMM) programs of the highest quality. All of our employees are committed to excellence in vector control and public health. We strive to improve the quality of human life in our communities through public education and the control of mosquitoes and the diseases they can transmit. CMC currently has programs across the state of Colorado, providing services for towns, cities, counties, homeowners associations, Indian reservations, and encephalitis surveillance monitoring programs for county and state health departments.

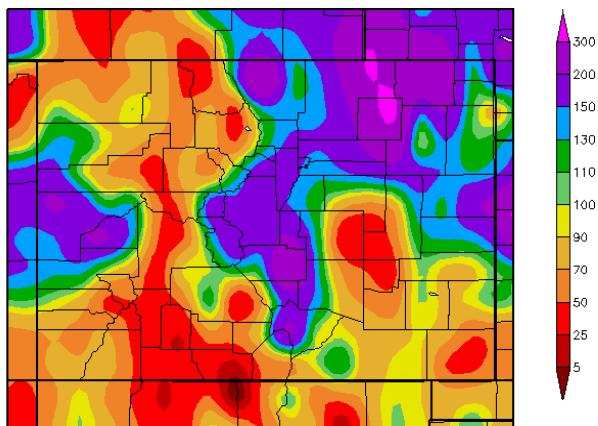

Colorado Mosquito Control, as the contractor for the City of Fort Collins, will continue to use proven scientific Integrated Mosquito Management techniques to survey and control local mosquito populations using bio-rational larval controls and limited low-toxicity insecticide applications. All of the methods and materials used by CMC have been reviewed and registered by the US Environmental Protection Agency, the Centers for Disease Control, the Colorado Department of Agriculture and the American Mosquito Control Association.

2015 Season Perspective

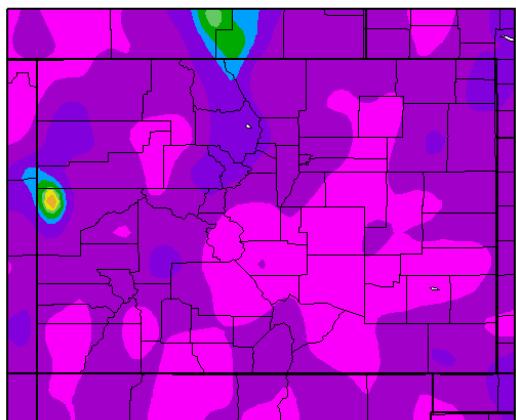

At CMC we have come to expect each Colorado summer to present a unique set of temperature, precipitation, irrigation, and human interactions that combine to create new and different challenges in both mosquito control and mosquito-borne disease proliferation. The summer of 2015 started off with record breaking rainfall and flooding along the Poudre and Platte River corridors which led to large populations of flood water mosquitoes throughout Northern Colorado.

According to the National Weather Service April was slightly warmer than normal with higher than average precipitation in Northern Colorado. The average temperature in the month of April was 49.75°F in Fort Collins, 49°F in Windsor, and 51°F in the City of Longmont. The total precipitation that occurred in the month of April 2015 was 3.32" in Fort Collins which is 161% higher than average for that time of year. Total precipitation was 1.81" in Windsor and 1.58" in the City of Longmont.

Percent of Normal Precipitation (%)
4/1/2015 – 4/30/2015

Percent of Normal Precipitation (%)
5/1/2015 – 5/31/2015

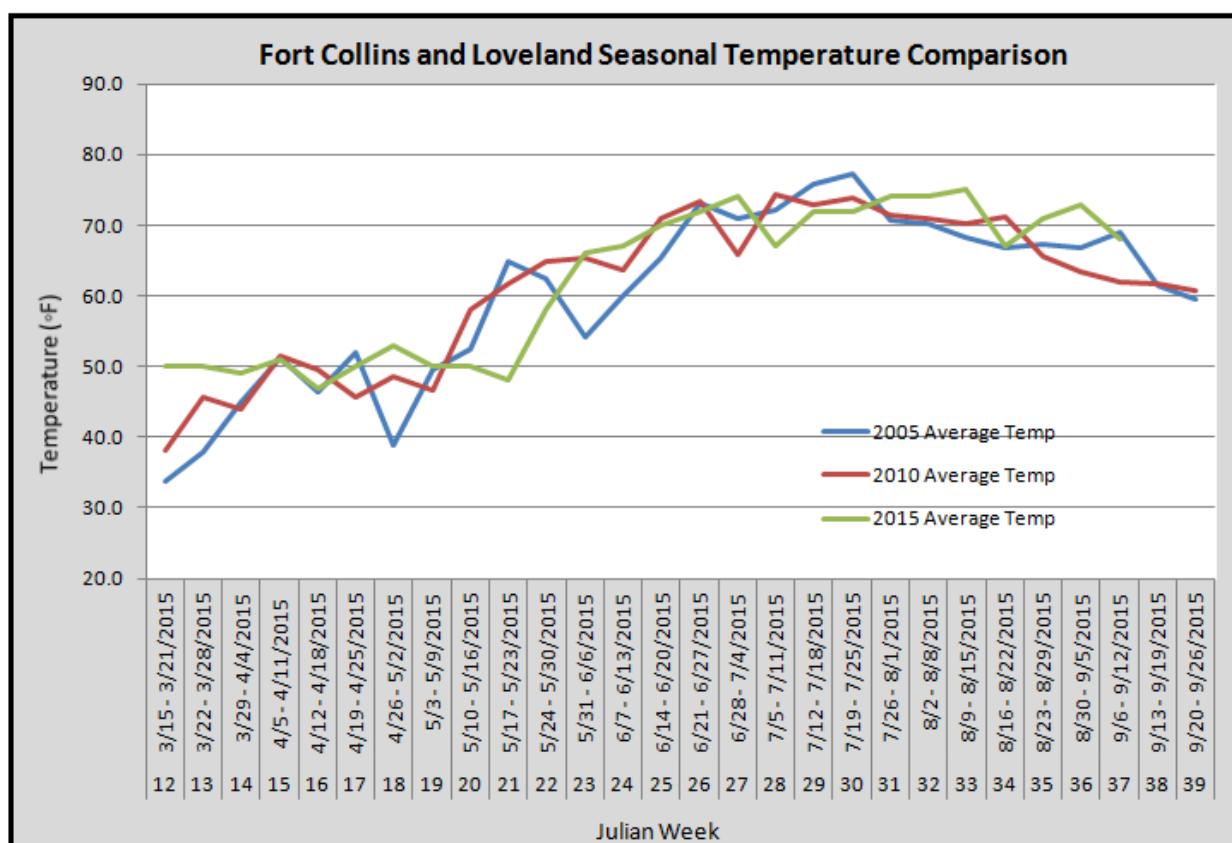

In May we saw cooler than average temperatures and again experienced well above average rainfall sustaining both *Culex* and *Aedes* larval habitat throughout the entire state. The total rainfall that fell in May 2015 was 6.34" in Loveland and Fort Collins which is 259% higher than average. The City of Longmont received a total of 3.61" of rain in May. The Town of Windsor received a total of 1.81" of precipitation. The average temperature in May was 52.75°F in Loveland and Fort Collins which is 5.25°F below average. The average temperature in Longmont was 54°F. The average temperature in Windsor was 52°F in May 2015.

Temperatures hovered 3-4°F above normal in much of Northern Colorado throughout June 2015. The average temperature in the month of June was 69.7°F in Fort Collins and Loveland, 69°F in Windsor, and 71.0°F in the City of Longmont. The total rainfall in the month of June was less than average with Fort Collins having only 1.55" compared to historical averages of 2.17" in the month of June. Windsor recorded 2.36" of rain in June 2015 and in the City of Longmont there was 1.17" of rain recorded.

Many areas along the Front Range of northern Colorado were at or slightly below normal average temperature in July 2015. The average temperature in the month of July 2015 was 71.5°F in Fort Collins and Loveland, 72°F in Windsor, and 74°F in the City of Longmont. The total rainfall in the month of July 2015 was 1.69" in Fort Collins which is directly in line with predicted precipitation data based on historical averages. We saw 0.92" in Windsor and 0.83" in the City of Longmont.

August 2015 continued to be a dry month leading to a reduction in larval mosquito habitat. The average temperature in the month of August 2015 was 67.1°F in Fort Collins which is slightly below average. The average temperature was 72°F in Windsor, and 74°F in the City of Longmont. The total rainfall that occurred in August was 0.69" in Fort Collins which is much lower than the expected average of 1.61". Average rainfall was 1.91" in Windsor and 0.22" in the City of Longmont. Nuisance reports and larval mosquito production subsided as the days became shorter and nighttime temperatures cooled into September.

West Nile Virus Season

West Nile virus (WNv) disease was first identified in Uganda in 1937. Since that time, activity has been documented throughout Africa, Europe, West and Central Asia, and areas of the Middle East. The virus made its first appearance to North America in 1999 when it was documented in New York City. WNV comes from a family of viruses known as Flaviviridae and is closely related to other encephalitis-causing viruses that can have severe effects on both humans and animals, including Western equine encephalitis and St. Louis encephalitis in our region.

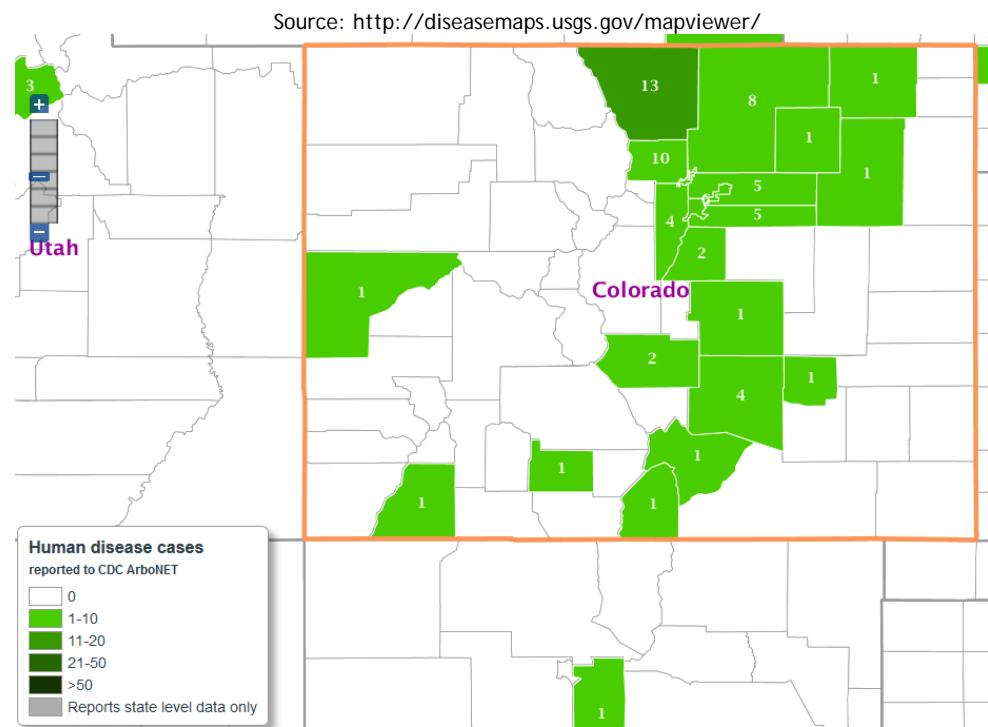

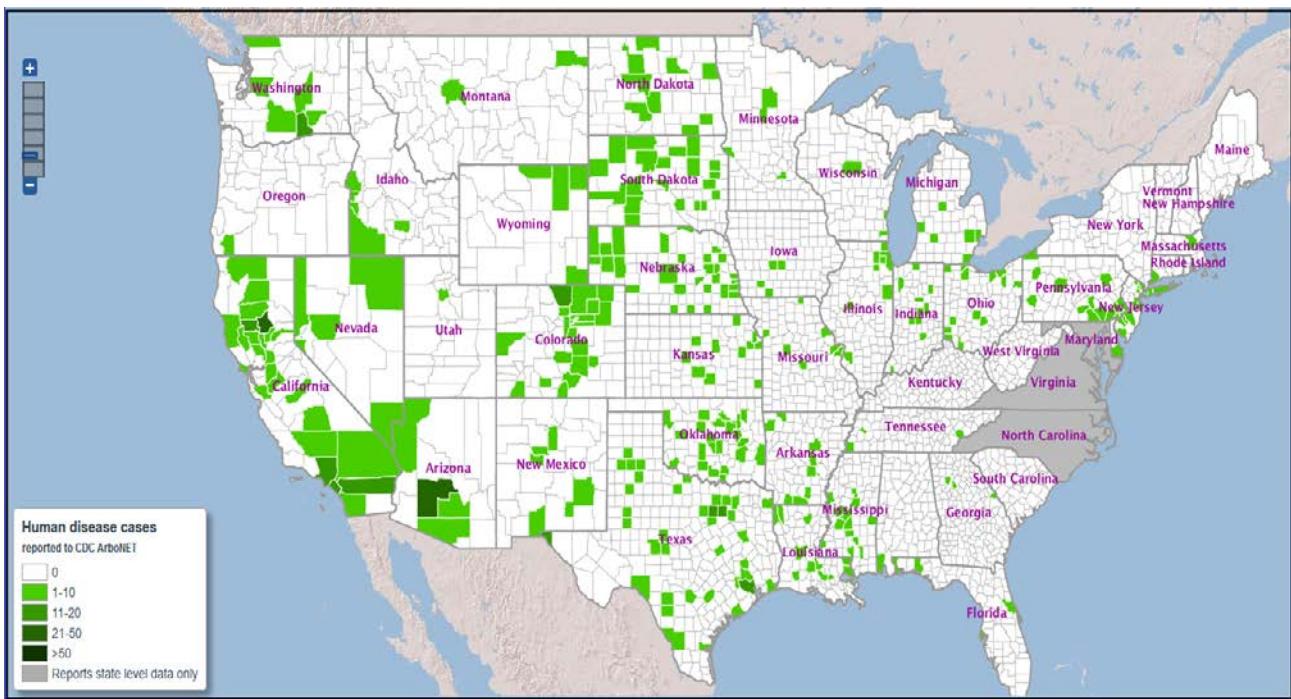

Since the introduction of WNV to the United States in New York City in 1999, the virus has made a complete westward expansion to the West Coast. Starting in the Northeastern parts of the United States, the virus steadily spread through the South, the Midwest, the Rocky Mountain region and to the Western States. This extensive distribution is due to the ability of WNV to establish and persist in the wide variety of ecosystems present across the country. WNv has been detected in 65 different mosquito species in the U.S., though it appears that only a few *Culex* species drive epizootic and epidemic transmission (WNv Guidelines CDC 2014). Although West Nile virus has been endemic to the United States since 1999, researchers continue to acquire an understanding for some of the factors which contribute to region specific spikes in vector abundance and human risk. We still do not understand why some humans develop West Nile fever while other infections develop into more serious West Nile encephalitis or West Nile meningitis cases. Additionally, physicians and researchers continue to seek answers to the variable recovery times and occurrence of deaths that result with some infections. WNv has expanded to the point that it can now be found in all 48 contiguous states and has produced two additional, large nationwide epidemics in 2003 and 2012 (WNv Guidelines CDC 2013).

As of September 22, 2015, a total of 47 states and the District of Columbia have reported West Nile virus infections in people, birds, or mosquitoes in 2015. Overall, 877 cases of West Nile virus disease in people have been reported to CDC. Of these, 538 (61%) were classified as neuroinvasive disease (such as meningitis or encephalitis) and 339 (39%) were classified as non-neuroinvasive disease.

Colorado 2015

As of September 18, Colorado has identified 74 cases of human West Nile virus (WNv) infections. Of these, 30 (41%) are uncomplicated fever, 20 (27%) are meningitis, 20 (27%) are Encephalitis (including meningoencephalitis), and 4 (5%) are asymptomatic blood donors. One additional WNv associated death was reported during the most recent week. The states cumulative total for the 2015 season is now at two (one each from Crowley County and Pueblo County).

As of September 18, the Colorado Department of Public Health and Environment reports that 2054 mosquito pools have been tested for WNv along with 24 birds, 24 horses, 2 cows, 2 deer and 2 bats. One hundred and sixty-four (164) mosquito pools have tested positive for the virus. Those mosquito pools were collected in Adams (4), Arapahoe (2), Boulder (9), Delta (1), Denver (9), Jefferson (2), Larimer (100), Mesa (1), Pueblo (7) and Weld Counties (29). Twelve birds (raptors) and twelve horses have also tested positive. Of note, Larimer County continued to trap and test mosquitoes through the week of September 15, 2015.

Clinical Diagnosis Associated
with Human WNV Infections
Colorado, 2015

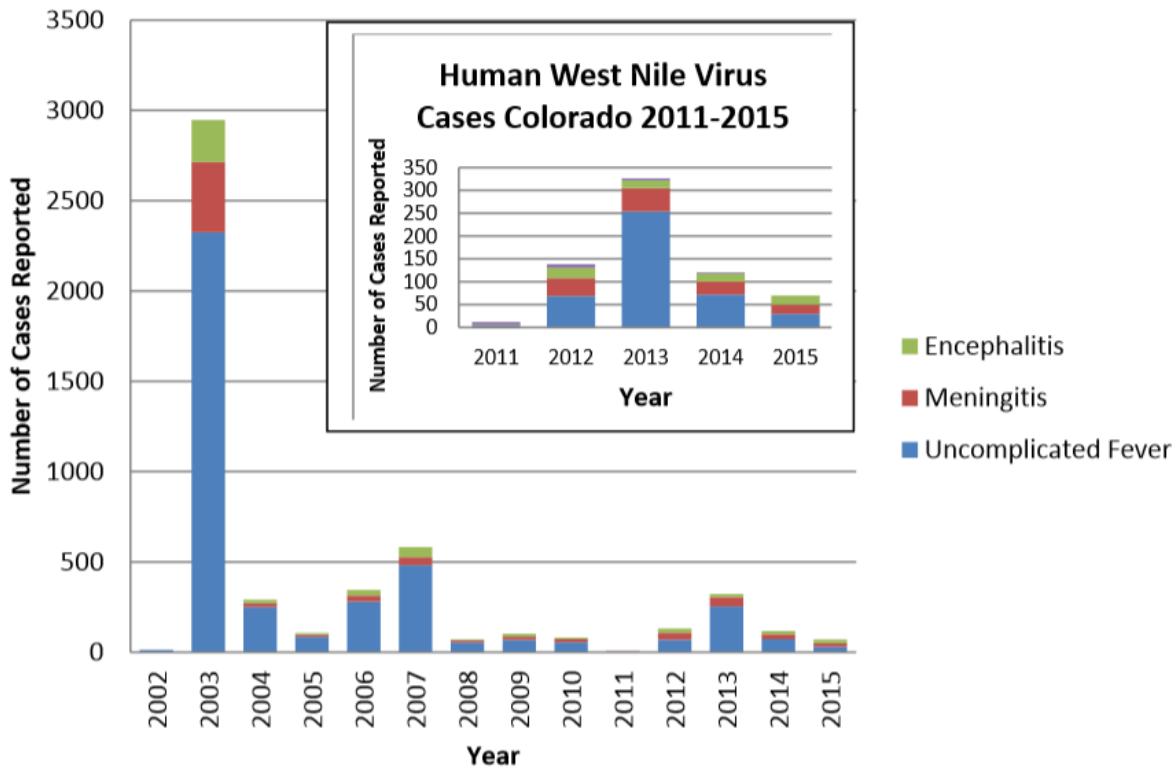

Type of WNV infection	Total cases	% of Cases	Deaths
Non-neuroinvasive (fever)	30	41%	
Neuroinvasive	40	54%	2
• Meningitis	20		
• Encephalitis (Includes meningoencephalitis)	20		2
Asymptomatic (Blood Donors)	4	5%	
TOTAL	74	100%	2

Age Distribution of Human WNV cases
Colorado, 2015

Age Group	Gender		Total
	Male	Female	
0-9	1	0	1
20-29	2	2	4
30-39	6	8	14
40-49	6	4	10
50-59	10	7	17
60-69	7	3	10
70-79	9	3	12
80-89	2	0	2
TOTAL	41	27	70

*Excludes 4 asymptomatic blood donors

**Human West Nile Virus Cases
Colorado 2002-2015**

Larval Mosquito Control

Larval mosquito control can be an extremely effective way to manage mosquitoes, thereby reducing the number of potential disease vectors and annoyances associated with biting adults. Years of research and practical experience have shown that the most effective way to control mosquito populations is through an aggressive Integrated Mosquito Management (IMM) approach. This approach aims at using a variety of concepts, tools, and products to reduce a pest population to a tolerable level.

Pre-season larval control work involved ground truthing GIS maps and remapping areas where new development or flooding had altered the landscape. CMC began larval site inspections in many areas mid-April. Hiring of seasonal field technicians began in March and continued into May. CMC's Annual Field Technician Classroom Training Day took place on May 18th with over 50 new and returning field technicians in attendance. Field training by CMC management and veteran employees lasted through May and full time field activities were in force by mid-May 2015.

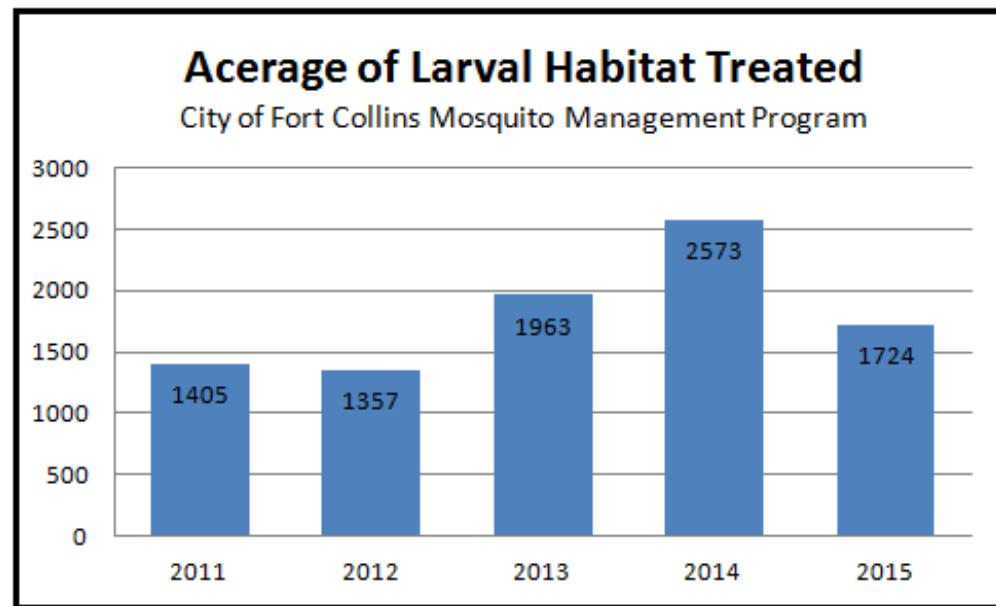

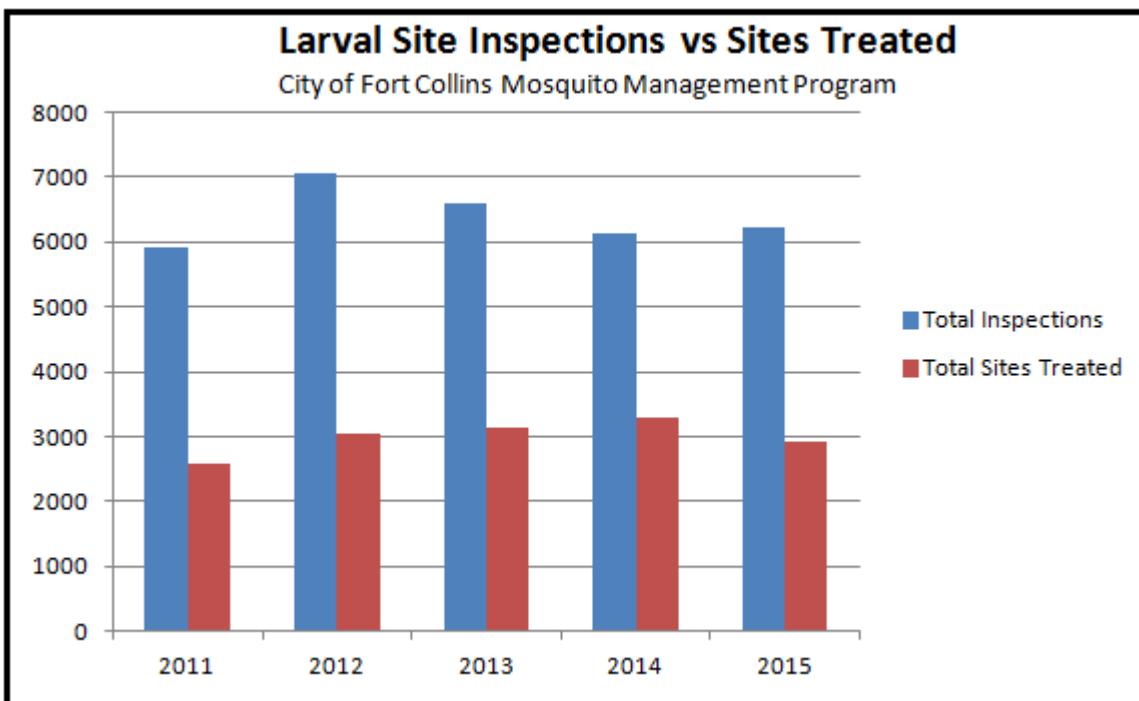

The 2015 City of Fort Collins Mosquito Management staff consisted of 16 Full-time Equivalent employees (FTE). Specifically, we had 1 Operations Manager, 1 Field Supervisor, 10 Field Technicians, 0.5 Surveillance Supervisor, 1 Surveillance Technician, 1 Urban Backyard Inspection/ Public Relations technician, 0.5 QC Inspector, 0.5 Office Staff, and 0.5 Maintenance Technician.

In 2015 Colorado Mosquito Control performed 6,229 larval site inspections, of which 5,354 sites (86%) were wet upon inspection and 2,917 (51%) were producing mosquito larvae in the City of Fort Collins. An estimated 5,007 million mosquito larvae were eliminated before emerging as biting adults via larvicide applications. CMC applied 11,600.8 lbs. of VectoBac (*Bti*), 503.3 lbs. of Vectolex (Bs), 2.9 lbs. of Altosid, and 210.0 gallons of BVA mineral oil to 1,724.5 acres of lands in the City of Fort Collins.

In 2015 CMC performed 209 larval mosquito inspections at residential backyards and urban sites, of which 142 sites (67.9%) were wet upon inspection and 94 (21.8%) were producing mosquito larvae within the City of Fort Collins. An estimated 5.4 million mosquito larvae were eliminated before emerging as biting adults via larvicide applications. CMC applied 3.9 lbs. of VectoBac (*Bti*), 1.4 lbs. of Altosid, and 0.5 gallons of BVA mineral oil to 6.7 acres of backyards and urban lands in the City of Fort Collins.

In 2015 CMC performed 123 inspections of storm drain grids within Fort Collins, of which 38.2% of the drains were wet upon inspection and 17% were producing mosquito larvae or treated for the potential to produce larvae in the City of Fort Collins. An estimated 800,000 mosquito larvae were eliminated before emerging as biting adults via larvicide applications at storm drains in Fort Collins. CMC applied 6.1 lbs. of VectoBac (*Bti*) and 1.4 lbs. to 3.3 acres of backyards and urban lands in the City of Fort Collins.

Larval mosquito control can be achieved in several ways including biological, biochemical, chemical, and mechanical means. No single larvicide product will work effectively in every habitat where mosquito larvae are found, so a variety of products and methods should be employed. Additionally, although there are a variety of methods for reducing larval populations, some may have negative consequences that outweigh their benefits. Mechanical or physical habitat modification, called Source Reduction, is a technique which CMC uses on relatively small scale projects, as the area to be modified and the extent to which the work will affect the surrounding area must be carefully reviewed. Permanent ecological damage may occur if extensive habitat change has taken place. True biological controls, such as the introduction of predacious animal species, can also cause negative environmental impacts that outweigh the benefit of their control capacity.

CMC's favored method of larval mosquito control is through the use of bacterial bio-rational products. The main product used by CMC is a variety of bacteria (*Bacillus thuringiensis* var. *israeliensis*). *Bti*, as it is known, has become the cornerstone of mosquito control programs throughout the world. The benefits include its efficacy and lack of environmental impacts. When used in accordance with its label, successful control of mosquito larvae can be achieved without impact to non-target species such as other aquatic invertebrates, birds, mammals, fish, amphibians, reptiles, or humans. A broad label allows for the use of the product in the majority of the habitats throughout the service area. Another bacterial product closely related to *Bti* is *Bacillus sphaericus* (*Bs*). *BS* provides similar benefits to *Bti* while also providing residual control of certain species of mosquitoes. It is used specifically in difficult to treat areas where *Culex* are the predominant species due to its limitations and cost.

Other larval control products include the insect growth regulator methoprene (Altosid), light mineral oils (BVA 2 larvicide oil), and an organophosphate (Abate). Methoprene is a synthetic version of a juvenile growth hormone in larval mosquitoes. The hormone prevents the normal development of larval mosquitoes into pupae and adults, eventually causing death. Abate is an effective product, but given its effects on non-target species, label restrictions limit its use in many areas. CMC limits the use of chemical larvicides to areas with little biodiversity, such as road side ditches, or areas that chronically produce high mosquito populations. They are only used after a thorough assessment has been made of any habitat where their use is being considered. Mineral oil is the only product effective in controlling mosquito pupae and therefore is an essential tool when pupae are present.

CMC Surveillance Laboratory

Information about mosquito abundance and species diversity is essential to integrated program. Colorado Mosquito Control employs two kinds of traps to monitor mosquito populations. The most commonly used is the CDC light trap which uses carbon-dioxide from dry ice as bait to attract female mosquitoes seeking a blood meal from a breathing animal. Once attracted by the CO₂, the mosquitoes are lured by a small light to a fan that pulls them into a net for collection. The second type of trap CMC uses is called a gravid trap. Gravid traps use a tub of highly-organic water as bait to attract female mosquitoes that are looking for a place to lay their eggs. A fan placed close to the water surface forces mosquitoes that come to the water into a collection net. Once back in the laboratory, the contents of the trap nets are counted and speciated by trained technicians.

In 2015, Colorado Mosquito Control monitored a statewide network of hundreds of weekly trap sites, collecting 694,362 adult mosquitoes that were counted and identified to species by the CMC Surveillance Laboratories. While individual traps provide only limited information, trap data is interpreted in the context of historical records for the same trap site, going back in time more than a decade. Individual traps are also compared to other traps from around the region that were set on the same night and therefore exposed to similar weather conditions. Technicians working in the Surveillance Laboratories at Colorado Mosquito Control are trained to provide accurate species-level identification of both larval and adult mosquitoes.

Additionally, the CMC Surveillance Laboratories conduct an intensive larval identification program with larval mosquito samples collected by I&L technicians. This information is valuable in targeting mosquito control efforts as we gain a greater understanding of the habitat types preferred by Colorado mosquito species and the seasonality of these habitats.

Specimens and data collected from these traps and larval identification are used in:

- Determining the effect of larval control efforts. Each mosquito species prefers specific kinds of habitats for larval development. If a trap produces large numbers, it could indicate the presence of an unknown larval habitat and, based on the species identification and known habitat preference for that species, direct field technicians as to possible sources of the mosquitoes collected.
- Determining larval and adult mosquito species. This helps to illustrate the threat of mosquito-borne disease amplification and transmission because different mosquito species can vector different diseases to people and animals.
- Determining where adult control efforts were necessary. While mosquito eradication is impossible, significant population reduction can be achieved. In places where larval

control is insufficient, such as neighborhoods where adult mosquitoes have migrated in from outside of the control area, it may be necessary to use adulticide methods, such as ULV truck fogging or barrier sprays of harborage areas. Trap counts that exceed an acceptable threshold for an area may trigger adult control measures.

Surveillance for Mosquito-borne Disease. Historically, CMC efforts were targeted primarily at controlling mosquito nuisance problems with limited disease surveillance. However, since the arrival of the West Nile virus in Colorado in August of 2002, the paradigm has shifted toward disease prevention and control. Accurate species identification of the mosquitoes in the traps is important when monitoring species population trends. It is also necessary for evaluating whether a population spike represents an actual increase in disease transmission potential or only an increased nuisance level.

SURVEILLANCE LIGHT TRAP DATA

In 2015, an average of 43 surveillance light traps and 10 gravid traps monitored adult mosquito populations within the City of Fort Collins. Surveillance trapping began the week of June 15th and was concluded on September 15th, per the City's mosquito surveillance budget. It is important to note that surveillance monitoring was pushed back by two weeks this year at request of the Larimer County Department of Health and the City of Fort Collins in order to assess West Nile prevalence later in the season.

There were 611 CDC light surveillance traps set during 2015 within City of Fort Collins, which collected a total of 86,364 mosquitoes. There was an average of 141 mosquitoes caught per trap per night and an average 43 *Culex* mosquitoes per trap per night. The composition of mosquitoes collected was 30.5% (26,339) *Culex spp.*, 66.8% (57,714) *Aedes/Ochlerotatus spp.*, 1.2% (1,062) *Coquillettidia perturbans*, 11 (less than 1.0%) *Anopheles spp.*, and 1.4% (1,238) *Culiseta spp.* Please refer to the Light Trap Genus Summary for a weekly breakdown of mosquitoes collected by trap location.

By comparison, there were 542 CDC light surveillance traps set during 2014 within City of Fort Collins, which collected a total of 73,339 mosquitoes. There was an average of 135 mosquitoes caught per trap per night and an average 55 *Culex* mosquitoes per trap per night. The composition of mosquitoes collected was 40.9% (30,023) *Culex spp.*, 57.0% (41,832) *Aedes/Ochlerotatus spp.*, 0.1% (64) *Coquillettidia perturbans*, 24 (less than 1.0%) *Anopheles spp.*, and 1.9% (1,396) *Culiseta spp.* Please refer to the Light Trap Genus Summary for a weekly breakdown of mosquitoes collected by trap location.

CDC SURVEILLANCE GRAVID TRAP DATA COMPARISON

The Technical Advisory Committee (TAC), which reviews the City of Fort Collins Mosquito Management Program and provides ideas to city council made the suggestion to increase the number of gravid traps being set in city limits from 5 to 10 traps in 2013. This suggestion was approved by city council and incorporated into the budget for West Nile virus mosquito surveillance in 2013. The enhancements to gravid trapping were included in the budget again in 2014 and 2015. Gravid traps were set weekly at 10 locations to obtain a better understanding of West Nile virus transmission activity across the City of Fort Collins. Gravid

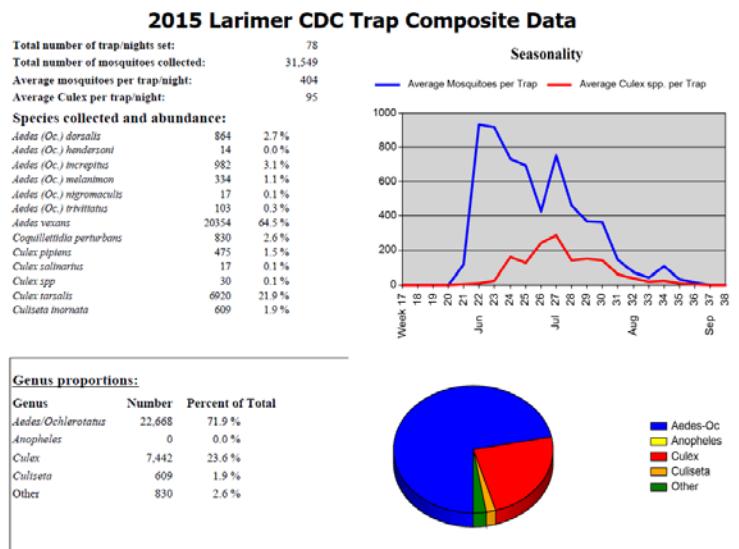

traps primarily attract *Culex pipiens*, which prefer avian hosts when seeking a blood meal. Trapping and testing of *Culex pipiens* mosquitoes provide an indicator of viral amplification based on the infection rates and abundance of *Culex pipiens*.

There were 140 gravid traps set in 2015, which collected a total of 7,680 mosquitoes. The species breakdown of mosquitoes collected included; 46 (0.6%) *Aedes/Ochlerotatus spp.*, 55 (0.7%) *Culiseta inornata*, 11 (0.1%) *Culex spp.*, 213 (2.8%) *Culex tarsalis*, and 7,352 (95.7%) *Culex pipiens* mosquitoes.

By comparison, there were 127 gravid traps set in 2014, which collected a total of 3,789 mosquitoes. The species breakdown of mosquitoes collected included; 17 (0.4%) *Aedes/Ochlerotatus spp.*, 7 (0.2%) *Culiseta inornata*, 247 (6.5%) *Culex spp.*, 67 (1.8%) *Culex tarsalis*, and 3,451 (91.8%) *Culex pipiens* mosquitoes.

CDPHE SEASONAL ADULT MOSQUITO POPULATION DATA COMPARISON

The Sentinel Encephalitis Surveillance Program was funded by the Colorado Department of Public Health and Environment (CDPHE), the City of Fort Collins and the City of Loveland for the ninth season this year. CMC maintained the sentinel system with five surveillance traps at permanent locations within a five mile radius (the center point at Fossil Ridge High School). The five surveillance trap locations were (FC-04) Bighorn Drive, (FC-14) Fort Collins Visitors Center, (FC-53) Egret and Rookery, (FC-67) Poudre River Trail at Mulberry and Lemay, and (LV-095) Waterfront at Boyd Lake. All *Culex* mosquitoes were sent to and tested by CSU. CSU sent test result data to the CDPHE for input into ArboNet. The sentinel light traps were set once a week from June 1st to September 17th. There were 78 sentinel surveillance traps set in 2015, which collected a total of 31,549 mosquitoes.

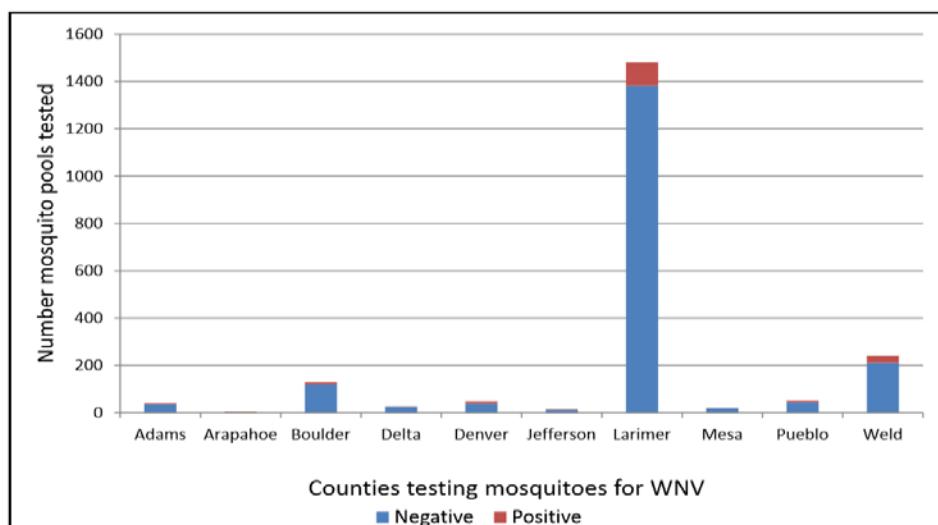

CSU WEST NILE VIRUS MOSQUITO SAMPLE TESTING RESULTS

Many local health departments have moved towards mosquito-based surveillance indicators to assess the weekly risk of West Nile transmission and guide response decisions for mosquito adulticiding. The vector index and infection rate is derived by testing the collected mosquitoes from CMC surveillance trapping for WNV infection. This value is closely monitored by the CDPHE and local health departments to evaluate the risk posed by the vector mosquito population.

As defined by CDC guidelines for WNV surveillance the vector index (VI) is an estimate of the number of West Nile virus infected mosquitoes in an area. This number can serve as a human health risk value. An operational value of 0.75, which was derived from comparison of historical data for human infections, as well as relative abundance and infection in mosquitoes, serves an indicator of high risk for West Nile virus transmission to humans in the corresponding area (<https://www.colorado.gov/>). As the value of the vector index increases there is a corresponding risk of human disease and this value can be used to offset epidemics.

Due to budget cutbacks associated with West Nile virus surveillance in recent years, the CDPHE does not have the ability to test mosquitoes from across the state. As a result, there is very limited testing done within unincorporated Larimer County. As stated on the CDPHE website, the seasonal variation of West Nile virus risk can change throughout a summer and it is best to assume you have some risk for WNV if you have mosquitoes.

Graph provided by CDPHE: https://www.colorado.gov/pacific/sites/default/files/DC_CD_Zoo-West-Nile-Virus-Report-2015_0.pdf

As reported by Dr. Greg Ebel with Colorado State University's Department of Microbiology, Immunology and Pathology, CSU tested a total of 1,776 mosquito pools in the 2015 mosquito season. Of these, 1,776 pools came from Fort Collins and 248 pools were collected from Loveland. Of the Fort Collins mosquito pools, 843 pools were comprised of *Cx. tarsalis* and 685 pools were comprised *Cx. pipiens* mosquitoes. Of the Loveland mosquito pools, 205 pools were comprised *Cx. tarsalis* and 43 pools were comprised *Cx. pipiens* mosquitoes. Testing of mosquitoes for West Nile virus is paid for by the City of Fort Collins and Loveland.

All tested pools were negative in weeks 23-25 (June 1st- June 27th) in Fort Collins and Loveland didn't see their first positive until Week 29. There were 97 WNV positive pools collected from Fort Collins and only 10 WNV positive pools from Loveland. The greatest number of WNV positive pools for a single week was recorded in week 35 (August 30th- Sept 5th). There were a total of 24 WNV positive pools collected during this week from across Fort Collins and Loveland, of which 22 were from Fort Collins and 2 from Loveland. The CDPHE ceased mosquito testing for WNV on August 31st 2015, CSU continued surveillance and testing in Loveland through September 5th and Fort Collins through September 17th.

Colorado Mosquito Control

ADULT MOSQUITO CONTROL

The goal of Colorado Mosquito Control is to provide all residents of Larimer County Cooperative Programs with the best options for effective modern mosquito management. The primary emphasis of the City of Fort Collins Mosquito Management Program is to control mosquitoes in the larval stage, using biological control products.

Although the thresholds for adult mosquito control operations in Fort Collins were not met during the 2015 season, it is important to note that CMC did perform ULV Truck based fogging adjacent to city limits at the request of the Larimer County Department of Public Health and Environment. This request was made in response to elevated West Nile virus risk in the northeast portion of the city. Colorado Mosquito Control traveled 45 miles of roads and trails in unincorporated Larimer County on August 13th, 2015.

CMC also performed adult mosquito control operations at the request of Greenstone, Willow Springs, Fossil Lake Ranch and Lindenwood HOAs during the 2015 season. CMC utilized the water-based product AquaLuer 20-20 for all ULV adult mosquito control operations in Larimer County. A total of 44.3 miles of roads and trails were included in these applications.

CMC uses state of the art technology, calibrated application timing, and least-toxic products to minimize non-target impacts. All adult mosquito control is accomplished using Ultra Low Volume (ULV) fogging equipment and performed after dusk when the majority of mosquito species are most active. This type of equipment produces droplets averaging 12 microns in diameter and allows for a minimal amount of product to be put into the environment. These treatments take place in the evening when mosquitoes are flying in greater numbers and non-target insect activity (for example, day-flying pollinators like bees) is greatly reduced. Using this application technique, the overall goal of minimal environmental impact and effective adult control is achieved in the targeted area.

Public Relations and Education

CMC is dedicated to providing strong Public Outreach and Education Programs to residents in all of our communities. Citizen complaints, inquiry, information and satisfaction surveys can aid in evaluating the effectiveness of a program. CMC constantly looks for ways to better serve the communities we work with and encourages both the citizen and local media involvement in order to increase the effectiveness of our programs. We have clearly demonstrated that commitment and belief by proactively serving the City of Fort Collins (and all of our contracted communities) with numerous innovative programs, activities and services.

Customer service is always a high priority for CMC. We take pride in training each and every technician so that they have the knowledge to provide residents with the correct answers to their questions. Each field technician spends part of their day responding to resident concerns in their work area. This in-field customer service personalizes the mosquito control program, provides CMC with local information on mosquito activity and presents a valuable opportunity to educate our residents about mosquito biology and control.

MosquitoLine™

CMC maintains a toll-free telephone line: (877) 276-4306 and local lines at 970-962-2582 and 970-663-5697 (at no cost to the customer) to accept calls from the public concerning:

- ❖ Information about mosquito biology and source reduction of mosquito habitats
- ❖ Information on program components, operations, and monitoring
- ❖ Seasonal West Nile virus activity
- ❖ Personal protection options for mosquito annoyances and West Nile virus risk
- ❖ Reports about mosquitoes and possible larval mosquito habitats
- ❖ Business opt-out of any adulticide spraying via a shut-off list and site inspection
- ❖ Request notification when adulticide spraying is planned in their neighborhood
- ❖ Request health and safety information about mosquito control operations and pesticide products used in the City of Fort Collins

CMC has provided Mosquito Hotlines to the residents in communities which we are contracted to also reduce workload by municipal personnel. This enables direct communication and response by mosquito control employees to resident's concerns about West Nile virus and larval site activity and treatment. CMC maintains a log of calls received and summarizes these calls in both monthly and annual reports.

In 2015 CMC fielded 32 phone calls from City of Fort Collins residents. Of these, there were 12 new larval site reports, 5 requests for information regarding West Nile positive activity in Larimer County, 4 requests for backyard inspections, 4 requests for private event application pricing, 2 individuals wanting to be added to the spray notification list, 2 mosquito annoyance reports, 1 shutoff request, and 1 fish request.

CALL NOTIFICATION & SHUTOFF SYSTEM

CMC continues to maintain a comprehensive Call Notification & Shutoff database and will notify residents on the list when conducting ULV adulticide spray applications within 2 blocks of their property or within the effective ULV spray drift distance (300-500 ft depending on wind speed and direction). All Shutoff locations are mapped in ArcView GIS. Call & Shutoff forms are available online and may be submitted via mail or email.

DAILY POSTING OF ULV SPRAY ZONES and Trap Data are maintained and updated online at

Season: 2015
 Trap Type: Gravid
 Location: Prospect Ponds @ Drake Water Reclamation Facility
 GPS: 105°1'21.635 W 40°33'30.973 N

Total number of trap/nights set: 14
 Total number of mosquitoes collected: 201
 Average mosquitoes per trap/night: 14
 Average Culex per trap/night: 14

Species collected and abundance:

<i>Aedes cinereus</i>	1	0.5 %
<i>Aedes vexans</i>	4	2.0 %
<i>Coquillettidia perturbans</i>	1	0.5 %
<i>Culex pipiens</i>	188	93.5 %
<i>Culex spp.</i>	1	0.5 %
<i>Culex tarsalis</i>	2	1.0 %
<i>Culiseta inornata</i>	4	2.0 %

Genus Proportions:

Genus	Number	Percent of Total
<i>Aedes/Oc</i>	5	2.5 %
<i>Anopheles</i>	0	0.0 %
<i>Culex</i>	191	95.0 %
<i>Culiseta</i>	4	2.0 %
Other	1	0.5 %
